Testing the CAPM: Mobil Exxon

The CAPM implies that the market rewards investors for the market risk

$$E(R_i) - R_f = \beta_i [E(R_m - R_f)]$$

where R_i is the return on  and R_m is the return on the market index.

- To estimate the CAPM, we run an OLS regression of excess returns on asset i , $X_{i,t}$, on the market return $X_{m,t}$

$$X_{i,t} = \alpha_i + \beta_i X_{m,t} + \mu_t$$

- If the CAPM holds, the null hypothesis $H_0 : \alpha_i = 0$ $H_a : \alpha_i \neq 0$ (two-tailed test)

observed value $\hat{t} = 0.721$, p-value = 0.472: decision: Do not reject the null.

- Joint hypothesis: $H_0 : \alpha_i = 0, \beta_i = 1$: observed $\hat{F} = 5.623$, $df = (2, 118)$
p-value = $P(F_{2,118} > \hat{F}) = 0.0046 \Rightarrow$ decision: Reject the null.

► PythonCode

Arbitrage Pricing Theory (APT)

程序代写代做 CS编程辅导

What determines the return of an asset?

Excess returns: $X_{i,t} = R_{i,t} - R_{f,t}$ and $X_{m,t} = R_{m,t} - R_{f,t}$

① CAPM:

WeChat: cstutorcs

$$E(X_{i,t}) = \alpha_i + \beta_i E(X_{m,t})$$

Assignment Project Exam Help

$$RP_i = \alpha_i + \beta_i RP_m$$

where RP_i : risk premium for asset i , RP_m market risk premium

② APT (Arbitrage Pricing Theory)

QQ: 749389476

$$E(X_{i,t}) = RP_i = \alpha_i + \beta_i RP_m + \beta_{other} RP_{other factors}$$

<https://tutorcs.com>

Arbitrage Pricing Theory (APT)

程序代写代做 CS编程辅导

What determines the return of an asset?

- APT (Arbitrage Pricing Theory): if there are r risk factors priced in the financial market, then:

WeChat: cstutorcs

$$RP_i = \alpha_i + \beta_i RP_m + \beta_{i,1} RP_1 + \cdots \beta_{i,r} RP_r$$

Assignment Project Exam Help

- RP_j is the **risk premium** for exposure to factor j risk, $j = 1, \dots, r$.
- $\beta_{i,j}$ is the sensitivity of the asset to factor j ; it also measures asset i 's exposure to the factor risk j

Email: tutors@163.com

QQ: 749389476

<https://tutorcs.com>

So what are the other risk factors in the APT?

程序代写代做 CS编程辅导

A well established APT in the finance literature is the Fama&French three factor model:

$$RP_i = \alpha_i + \beta_{i.m} RP_m + \beta_{i.s} RP_s + \beta_{i.h} RP_h + \beta_{i.u} RP_u \quad (1)$$

WeChat: cstutorcs

- RP_m is the market risk premium
- RP_s is the size factor risk premium (*small market capitalisation*)
- RP_h is the value factor risk premium (*high book-to-market stocks*)
- RP_u is the momentum risk factor premium (prior gains)
- $\beta_{i.m}, \beta_{i.s}, \beta_{i.h}$ and $\beta_{i.u}$ are the betas for the market risk, size factor, value factor and momentum respectively

https://tutorcs.com

Example 1: Expected Return

程序代写代做 CS编程辅导

Based on the following data and risk-free rate of return of 2%, compute expected return under APT.

	Beta of each factor	Risk Premium
$\beta_{i.m}$	1.2	RP_m 5.1
$\beta_{i.s}$	0.8	RP_s 0.5
$\beta_{i.h}$	0.2	RP_h 0.95
$\beta_{i.u}$	-0.1	RP_u 2.5

Solution:

$$\begin{aligned}
 E(R_i) &= R_f + \alpha_i + \beta_{i.m}RP_m + \beta_{i.s}RP_s + \beta_{i.h}RP_h + \beta_{i.u}RP_u \\
 &= 2\% + 1.2 \times 5.1\% + 0.8 \times 0.5\% + (0.2) \times 0.95\% + (-0.1) \times 2.5\%
 \end{aligned}$$

$$E(R_i) = 8.46\%$$

<https://tutorcs.com>

Question 1: NIKE

程序代写代做 CS编程辅导

Given the risk-free rate of return of 1.0%, average return of Nike (i.e: S&P 500 company with small market cap) of 15.88% p.a and the data provided in table below:

- Q1(a) Compute the expected return of the NIKE under APT model;
 Q1(b) Determine the alpha of the NIKE;
 Q1(c) Construct a portfolio comprising S&P500 index fund (market portfolio), Wilshire 5000 index fund, Russell 1000 value index fund and US T-Bills to replicate the expected return of Nike.

Assignment Project Exam Help

Table 1: Factor beta, returns and risk premium

Factor	Beta	R	Risk Premium
RP_m	0.7877	14.5%	13.49%
RP_s	0.6701	14.65%	0.15%
RP_v	-0.0288	10.38%	-4.12%

<https://tutorcs.com>

- (i) RP_m is the market risk premium, i.e: excess of S&P500 return over the risk-free rate of return;
 (ii) RP_s is the size factor risk premium, i.e: excess of Wilshire 5000 index returns over the S&P500 returns (iii) RP_v is the value factor risk premium, i.e: excess of Russell 1000 index returns over the S&P500 returns.

Solution to Question 1

程序代写代做 CS编程辅导

$$E(R_{NKE}) = R_f + \beta_{NKE} E(R_m - R_f) + \beta_{NKE,s}(R_s - R_m) + \beta_{NKE,v}(R_v - R_m)$$

$$(i) E(R_{NKE}) = 1.0\% + (0.7877)(13.49\%) + (0.6701)(15\%) + (-0.0288)(-4.12\%) = 11.85\%$$

$$(ii) \alpha_{NKE} = \text{Actual return} - \text{Expected return} = 15.88\% - 11.85\% = 4.03\%$$

WeChat: cstutorcs

(iii) Replicating portfolios' weights:

Assignment Project Exam Help

$$\begin{aligned} E(R_i) &= R_f + \beta_{i,m} E(R_m - R_f) + \beta_{i,s} E(R_s - R_m) + \beta_{i,v} E(R_v - R_m) \\ &= R_f (1 - \beta_{i,m}) + (\beta_{i,m} - \beta_{i,s} - \beta_{i,v}) E(R_m) + \beta_{i,s} E(R_s) + \beta_{i,v} E(R_v) \\ &= w_{i,Rf} R_f + w_{i,m} E(R_m) + w_{i,s} E(R_s) + w_{i,v} E(R_v) \end{aligned}$$

QQ: 749389476

$$w_{i,Rf} = 1 - \beta_m = 1 - 0.7877 = 0.2123$$

$$w_{i,m} = \beta_{i,m} - \beta_{i,s} - \beta_{i,v} = 0.7877 - (0.6701) - (-0.0288) = 0.1464$$

$$w_s = \beta_{i,s} = 0.6701$$

$$w_v = \beta_{i,v} = -0.0288$$

https://tutorcs.com

Solution to Question 1 continued

程序代写代做 CS编程辅导

Replicating portfolio: (a) long position: 21.23% in US T-Bills,
 (b) long position: 14.64% in market portfolio (or S&P500 market index fund),
 (c) long position: 67.01% in Russell 5000 index fund, and
 (d) short 2.88% in Russell 1000 Value index fund.

WeChat: cstutorcs

Computing the expected return of replicating portfolio:

$$R_f = 1.0\% \quad W_{Rf} = 0.2123$$

$$E(R_m) = 14.5\% \quad W_m = 0.1464$$

$$E(R_s) = 14.65\% \quad W_s = 0.6701$$

$$E(R_v) = 10.38\% \quad W_v = -0.0288$$

$$E(R_{AAPL}) =$$

$$0.2123 \cdot 1.0\% + 0.1464 \cdot 14.5\% + 0.6701 \cdot 14.65\% - 0.0288 \cdot 10.38\% \\ = 11.85\%$$

Estimating & Testing the APT: Exxon Example

程序代写代做 CS编程辅导

What determines the return of Exxon Mobil?

The APT extends the CAPM to allow for additional **risk factors** $X_{u,t}$ (eg. unexpected macro events, unexpected changes in firm profits, etc)

$$X_{u,t} = (INF, OIL) \quad H_0 : \gamma_{INF} = \gamma_{OIL} = 0,$$

Do we reject?

WeChat: cstutorcs

► PythonCodeAPT

Test for Autocorrelation

程序代写代做 CS编程辅导

H_0 : No autocorrelation in error term μ_t

① Durbin-Watson test

Reject H_0 if DW is significantly different from 2.

② LM test for autocorrelation (Breush-Godfrey):

- Run OLS on the original regression

$$Y_t = \beta_0 + \beta_1 X_{1t} + \cdots + \beta_K X_{Kt} + \mu_t \quad (2)$$

and save residuals e_t

- Run OLS on the auxiliary regression

$$e_t = \gamma_0 + \gamma_1 X_{1t} + \cdots + \gamma_K X_{Kt} \quad (3)$$

$$+ \delta_1 e_{t-1} + \cdots + \delta_q e_{t-q} + \text{error}_t, \quad (4)$$

and save R -squared R_a^2 ;

- Reject H_0 if $(T - q)R_a^2 > \chi^2_{q, \alpha}$ -critical value.

Test for Heteroskedasticity

程序代写代做 CS编程辅导

H_0 : Homoskedasticity Error term μ_t

① LM test (White)

- Suppose the original equation has only two regressors.
- Run OLS on the original equation

$$Y_t = \beta_0 + \beta_1 X_{1t} + \beta_2 X_{2t} + \mu_t \quad (5)$$

and save residuals e_t

- Run OLS on the auxiliary regression

$$e_t^2 = \gamma_0 + \gamma_1 X_{1t} + \gamma_2 X_{2t} \quad (6)$$

$$+ \delta_1 X_{1t}^2 + \delta_2 X_{2t}^2 + \delta_3 X_{1t} X_{2t} + error_t, \quad (7)$$

and save R -squared R_a^2 ;

- Reject H_0 if $TR_a^2 > \chi_m^2$ critical value, where m is the number of regressors in the auxiliary regression, here ($m = 5$)

Notice the problem of m increasing with K ($m = 2K + \frac{K(K-1)}{2}$)

WeChat: cstutorcs

Assignment Project Exam Help

Email: tutores@163.com

QQ: 749389476

https://tutores.com

Test for Heteroskedasticity

程序代写代做 CS编程辅导

② Alternative method Breusch-Pagan LM test

- Run OLS on the original regression

$$Y_t = \beta_0 + \beta_1 X_{1t} + \cdots + \beta_K X_{Kt} + \mu_t \quad (8)$$

and save residuals e_t , and predicted values \hat{Y}_t

- Run OLS on the auxiliary regression

$$e_t^2 = \gamma_0 + \gamma_1 \hat{Y}_t + \gamma_2 \hat{Y}_t^2 + error_t, \quad (9)$$

and save R -squared R_a^2 ;

- Reject H_0 if $TR_a^2 > \chi^2_{2-critical value}$.

<https://tutorcs.com>

Example: Mobil

程序代写代做 CS编程辅导

Dependent Variable: E_MOBIL				
Method: Least Squares				
Sample: 1978M01 1987M12				
Included observations: 120				
Variable	Coefficient	Std. Error	t-Statistic	Prob.
C	0.004241	0.003481	0.721083	0.4723
E_MARKET	0.714695	0.085615	8.347761	0.0000
R-squared	0.371287	Mean dependent var		0.009353
Adjusted R-squared	0.365959	S.D. dependent var		0.080468
S.E. of regression	0.064074	Akaike info criterion		2.612010
Sum squared resid	0.484452	Schwarz criterion		-2.594561
Log likelihood	160.4612	F-statistic		69.68511
Durbin-Watson stat	2.087124	Prob(F-statistic)		0.000000

Breusch-Godfrey Serial Correlation LM Test:

F-statistic	0.229380	Probability	0.795386
Obs*R ²	0.472709	Probability	0.789501

White Heteroskedasticity Test:

F-statistic	3.587532	Probability	0.030751
Obs*R ²	6.933821	Probability	0.031213

QQ: 749389476

- No evidence for AC in the error term (large p-value).
- Strong evidence for heteroskedasticity (small p-value).
- Strong evidence for non-normality (small p-value).

Robust Standard Errors

程序代写代做 CS编程辅导

- The key assumption $E(u_t | X_t) = 0$
(which may be weak) $E(u_t | X_t, \mu_t) = 0$.

Can we test for this 'key assumption'? How would the test look like?

- Even when there is heteroskedasticity or autocorrelation in μ_t , the OLS estimators are still consistent. However, the standard errors of the estimators are incorrect and MUST be corrected.
- In practice, we should always use **robust standard errors** that correct the effect of heteroskedasticity and/or autocorrelation.
 - ① White standard errors (correct heteroskedasticity)
 - ② Newey-West (HAC) standard errors (correct jointly heteroskedasticity and autocorrelation.)

<https://tutorcs.com>

Example: Mobil

程序代写代做 CS编程辅导

OLS s.e.				
Variable	Coefficient	Std. Error	t-Statistic	Prob.
C	0.004241	0.005881	0.721087	0.4723

<https://tutorcs.com>

Miscellaneous issues

程序代写代做 CS编程辅导

- **Dynamics:** the lags included in the RHS of the regression
eg. Mobil" $X_{i,t} = \alpha + \beta X_{m,t} + \gamma X_{i,t-1} + \mu_{i,t}$
- **Dummy variable** WeChat: cstutorcs
 - Stock market event:

$$Y_t = \beta_0 + \beta_1 X_t + \beta_2 D_t X_t + \mu_t \quad (10)$$

$D_t = 0$ pre crisis and $D_t = 1$ post crisis.

The effect of X_t on Y_t is β_1 before the crisis but becomes $(\beta_1 + \beta_2)$ after the crisis.

- Day-of-the-week effects: $D_t = \begin{cases} 0, & t \text{ is not on a Friday} \\ 1, & t \text{ is on a Friday} \end{cases}$

<https://tutorcs.com>

Model Stability

程序代写代做 CS编程辅导

Model stability: Does the model change over time?

① Recursive parameter estimates

Monitor changes in parameter estimates over time.

- Start from an initial sample of size τ , estimate the model, get $\hat{\beta}(\tau)$,
- add one observation to the sample, estimate the model, get the $\hat{\beta}(\tau + 1)$,
- Continue recursively until last estimate with full sample $\hat{\beta}(T)$

- eg. Mobil: Stability of the CAPM Model $X_{i,t} = \alpha + \beta X_{m,t} + \mu_{i,t}$

Recursive estimates of the market beta β .

Model Stability

程序代写代做 CS编程辅导

② Recursive residuals

- Estimate recursive model parameters:

$$\hat{\beta}(\tau), \hat{\beta}(\tau + 1), \dots$$

- estimate recursive residuals: $e_{\tau+1|\tau} = Y_{\tau+1} - \mathbf{X}_{\tau+1}\hat{\beta}(\tau)$

$$e_{\tau+1|\tau}, e_{\tau+2|\tau}, \dots$$

If the model is correct (stable),

WeChat: cstutorcs

$$W_{\tau+1|\tau} = \frac{e_{\tau+1|\tau}}{se(e_{\tau+1|\tau})} \sim N(0, 1) \quad (11)$$

Assignment Project Exam Help

Mobil Recursive Residuals (CAPM)

Model Stability

程序代写代做 CS编程辅导

③ **CUSUM Test** (cumulative sum of standardised recursive residuals)

$$CU_t = \sum_{\tau=K+1}^t W_{\tau+1|\tau}, \quad (12)$$

$$t = K+1, K+2, \dots, T-1$$

WeChat: cstutorcs

Reject Stability if it goes outside the 95% bands

eg. Mobil CUSUM test: Assignment Project Exam Help

Summary

程序代写代做 CS编程辅导

① Linear regression

- What are the basic assumptions about linear regression
- What are OLS estimators and their properties
- What are the diagnostic statistics we have covered
- Why we should use robust standard errors
- What are recursive estimates of β
- What is the CUSUM test

② Applications in finance

- CAPM is about the relationship of ...
- APT is an extension of ...
- These can be evaluated with a ... model.
